Setting up IAX2 trunks between a&a-asterisk members

IAX2 trunks are pretty easy to setup once an agreement has been made with a fellow A&A-asterisk user.

You will both need to exchange 2 pieces on relevant information:

- username
- server IP/hostname

Once you have these you need to setup your IAX.conf file:

Server A

```
[server_b]
username=server_a
secret=passwd
disallow=all
allow=g726
type=friend
context=incoming-work
auth=md5
host=server_b.example.com
qualify=2000
trunk=no
```

Server B

```
[server_b]
username=server_b
secret=passwd
disallow=all
allow=g726
type=friend
context=incoming-work
auth=md5
host=server_a.example.com
qualify=2000
trunk=no
```
